

My Dream job: VIDEO GAME PROGRAMMING

introduction

My dream is to work as a video game programmer. The idea of creating something that people can enjoy playing my video games really excites me. For me, programming is a perfect combination of problem solving and being creative. I want to use these skills to create games that not only entertain but also make people feel something every time they play, incredibly passionate about this field and determined to continue learning and growing to build a successful career in game development.

Education and coursed

To prepare for this career, I have been learning through online courses. I have learned programming languages like Python and Java, which are the most common in the programming industry. I have also tested with game engines like Unity and Unreal Engine, which are the tools that developers use to make 2D and 3D games. In addition to that, I have taken some courses on game design to understand how to make games fun and easy for players to enjoy.

Work experience

I have not yet had a professional job in game development, but I have worked on several personal projects. I've made quite simple games using the Unity program, where I learned how to use graphics, sounds, and encoding. I have also been with other students to learn to work in a team.

Skills developed

Through these projects, I have learned many useful skills that will help me when programming. I have definitely improved in programming, and I am much more fluent

in writing code that makes games work smoothly. I've also learned some basic graphic design, which has allowed me to create my own gaming sprites. Working with others has also been a great experience, and has helped me improve my teamwork and communication skills.

Fiance aspected

When it comes to salary, I know that you don't earn much at first because it goes through sales. But it takes a lot of time to earn around €25,000 a year as a video game programmer. I have also realised how important it is to manage money while working on game projects. Sometimes you need to manage a budget for things like software, licences, or even hire additional people to help with the project.

Career Goals

My goal for the future is to be able to work in an important company and lead a team. I would like to work in all kinds of games such as PC or consoles, even if I could have my own video game development company. I know there will be challenges along the way, but I am sure that my passion, dedication and drive will help me overcome them and achieve my goals.
